The Lipids: Triglycerides, Phospholipids, and Sterols

Chapter 5
The Lipid Family

- **Triglycerides (fats and oils)**
  - Predominate in the body (99%) and in foods (95%)
  - Composed of Carbon, Hydrogen and Oxygen
  - 9 kcalories per gram

- **Phospholipids (such as lecithin)**

- **Sterols (such as cholesterol)**
Chemist’s View of Fatty Acids and Triglycerides

Triglycerides
1. Composed of glycerol + 3 fatty acids
2. Fatty acids may be 4-24 carbons long
   - Even numbers
   - 18 carbons fatty acids most common
3. Saturated or Unsaturated
   - monounsaturated or polyunsaturated
4. Omega-3 and Omega-6 fatty acids are of importance in nutrition.
5. Essential Fatty acids include:
   - Omega-3-linolenic
   - Omega-6 linoleic
What is a Fatty Acid?

- Composed of a chain of carbon atoms with hydrogen atoms attached
- Have an acid group at one end and a methyl group at the other end.
- Usually even numbers of carbons
A Fatty Acid

Stearic acid, an 18-carbon saturated fatty acid.

Stearic acid (simplified structure).
Fatty Acids

Chain Length

- Long-chains are 12 - 24 carbons in length
  - common in meats, fish and vegetable oils
  - 18-carbon fatty acids are abundant in food
- Medium chains are 6 - 10 carbons
  - coconut and palm oils
- Short chains are < 6 carbons
  - dairy products
The Number of Double Bonds

Degree of Saturation

- Saturated fatty acid: contains the maximum possible number of hydrogen atoms
- No double bonds

- Stearic acid; 18 carbon saturated fatty acid
The Number of Double Bonds

- **Unsaturated fatty acid:**
  - Has some hydrogen atoms missing and therefore has at least 1 double bond

- **Monounsaturated fatty acid:**
  - Has 1 double bond (missing 2 hydrogen atoms)
  - *oleic acid* found in olive oil and canola
The Number of Double Bonds

- **Polyunsaturated fatty acid:**
  - has 2 or more double bonds
  - *linoleic acid has 2*
  - *linolenic acid found in soybean oil has 3*

- 18 carbon polyunsaturated fatty acid
  - *linoleic acid*
  - found in corn, safflower, sunflower, and soybean oils
Stearic acid, an 18-carbon saturated fatty acid

Oleic acid, an 18-carbon monounsaturated fatty acid

Linoleic acid, an 18-carbon polyunsaturated fatty acid
# 18-Carbon Fatty Acids

**NOTE:** Chemists use a shorthand notation to describe fatty acids. The first number indicates the number of carbon atoms; the second, the number of the double bonds. For example, the notation for stearic acid is 18:0.
Location of the Double Bonds

- **Omega Number**
- Polyunsaturated acids are identified by the location of their double bond:
  - The *omega* number indicates the position of the 1\(^{st}\) double bond in a fatty acid.
  - Counting from the CH\(_3\) group (methyl group).

Linolenic acid, an omega-3 fatty acid

[Diagram showing the location of the double bond in linolenic acid]
Omega-3 and Omega-6 Fatty Acids Compared

Linolenic acid, an 18-carbon, omega-3 fatty acid

Linoleic acid, an 18-carbon, omega-6 fatty acid
Chemist’s View of Fatty Acids and Triglycerides

- Triglycerides
  - 1 glycerol molecule
  - 3 fatty acids
  - Formed via a condensation reaction
  - Usually contains a mixture of fatty acids (saturated and unsaturated)
Triglyceride Formation
Condensation Reactions

An H atom from glycerol and an OH group from a fatty acid combine to create water, leaving the O on the glycerol and the C at the acid end of each fatty acid to form a bond.

Three fatty acids attached to a glycerol form a triglyceride and yield water. In this example, all three fatty acids are stearic acid, but most often triglycerides contain mixtures of fatty acids (as shown in Figure 5-5).

http://nutrition.jbpub.com/animations/animations.cfm?id=10&debug=0
A Mixed Triglyceride

Glycerol

fatty acids (18-c saturated) stearic acid
fatty acids (18-c monounsaturated) oleic
fatty acids (18-c polyunsaturated) linoleic
Characteristics of solid fats and oils

Degree of Unsaturation

Firmness

• **Unsaturated:**
  • Liquid at room temperature
  • Polyunsaturated vegetable oils
  • Vegetable oils make up much of the added fat in the U.S. diet
  • Fast-food chains use them for frying
  • Food manufacturers add them to processed foods
Characteristics of solid fats and oils

Degree of saturation influences firmness at room temperature

- More saturated fats are solid at room temperature
  - Animal fats (fat on the meat and fat in dairy)
  - Tropical Oils – palm oil, palm kernel oil, coconut oil, cocoa butter
  - Softer due to shorter carbon chain
Saturated fatty acids tend to stack together. Consequently, saturated fats tend to be solid (or more firm) at room temperature.

This mixture of saturated and unsaturated fatty acids does not stack neatly because unsaturated fatty acids bend at the double bond(s). Consequently, unsaturated fats tend to be liquid (or less firm) at room temperature.
Fatty Acid Composition of Common Food Fats

**Key:**
- Red: Saturated fatty acids
- Green: Polyunsaturated, omega-6 fatty acids
- Blue: Monounsaturated fatty acids
- Yellow: Polyunsaturated, omega-3 fatty acids

**Animal fats and the tropical oils of coconut and palm contain mostly saturated fatty acids.**
- Coconut oil
- Butter
- Beef tallow (beef fat)
- Palm oil
- Lard (pork fat)
- Chicken fat

**Some vegetable oils, such as olive and canola, are rich in monounsaturated fatty acids.**
- Olive oil
- Canola oil
- Peanut oil

**Many vegetable oils are rich in omega-6 polyunsaturated fatty acids.**
- Safflower oil
- Sunflower oil
- Corn oil
- Soybean oil
- Walnut oil
- Cottonseed oil

**Only a few oils provide significant omega-3 polyunsaturated fatty acids.**
- Flaxseed oil
- Fish oil (salmon)

*Salad or cooking type over 70% linoleic acid.*
Characteristics of solid fats and oils

- **Stability**
  - Fat becomes spoiled when exposed to oxygen
  - Particularly polyunsaturated
  - Saturated fats are most resistant to oxidation

To prevent rancidity food companies:
- Use air-tight seals and refrigeration
- Antioxidants are added - BHA, BHT, Vitamin E
- Hydrogenation
What is Hydrogenation?
The process of adding hydrogen to unsaturated fatty acids to make the fat more solid and resistant to the chemical change of oxidation

- Protects against oxidation
- Alters texture of the food by making liquid vegetable oils more solid
- Produces trans fatty acids
Double bonds carry a slightly negative charge and readily accept positively charged hydrogen. Most often fat is partially hydrogenated, creating a trans-fatty acid.
Cis-and Trans-Fatty Acids Compared

A *cis*-fatty acid has its hydrogens on the same side of the double bond; *cis* molecules bend into a U-like formation. Most naturally occurring unsaturated fatty acids in foods are *cis*.

A *trans*-fatty acid has its hydrogens on the opposite sides of the double bond; *trans* molecules are more linear. The *trans* form typically occurs in partially hydrogenated foods when hydrogen atoms shift around some double bonds and change the configuration from *cis* to *trans*. 
Characteristics of solid fats and oils

- **Hydrogenated Vegetable Oil**
  - Prevents spoilage of unsaturated fats
  - Hydrogenated oil is used in frying
    - Can be heated to high temperature
  - Easy to handle, easy to spread
  - Once fully hydrogenated, an oil loses both its unsaturated character and health benefits
  - The stick margarines may contain almost 50% of their fat as trans fat
Phospholipids are soluble in both water and fat

- Cell membranes
  - Help lipids move across cell membranes, such as vitamins, and hormones
- Emulsifiers-keep fat suspended in body fluids
Lecithin

From glycerol

From phosphate

From 2 fatty acids

The plus charge on the N is balanced by a negative ion—usually chloride.

From choline
Phospholipids

- Phospholipids in food
  - Found in foods such as eggs, liver, soybeans, wheat germ, peanuts
  - Used in food industry as emulsifiers in foods such as mayonnaise and salad dressings and candy bars
Sterols

- **Sterols in Food:**
  - Most common one is **cholesterol**;
    - Found only in foods of animal origin
    - Meat, eggs, fish and poultry, dairy
  - Plant sterols (phytosterols)
    - Naturally found plants but in very low levels
    - Plant sterols block cholesterol absorption
    - Plant sterols have been added to common foods such as vegetable oil spreads, dairy drinks, snack bars
Sterols

- **Roles of sterols:**
  - Cholesterol (component of cell membranes)
    - Made in the liver
  - Bile acids
  - Sex hormones
  - Adrenal hormones
  - Vitamin D

- Cholesterol can be used as the starting material to make these compounds
Cholic Acid and the Sex Hormones

- **Cholic Acid**
- **Progesterone**
- **Testosterone**
- **Estradiol**

**Key:**
- **Milk and milk products**
- **Meats**
- **Miscellaneous**

**CHOLESTEROL**

Only foods of animal origin contain significant cholesterol. Consequently, grains, vegetables, legumes, and fruits provide virtually no cholesterol.

© 2007 Thomson Higher Education
Lipid Digestion In the GI Tract

**Mouth and salivary glands**
Some hard fats begin to melt as they reach body temperature. The sublingual salivary gland in the base of the tongue secretes lingual lipase. The degree of hydrolysis by lingual lipase is slight for most fats but may be appreciable for milk fats.

**Stomach**
The stomach’s churning action mixes fat with water and acid. A gastric lipase accesses and hydrolyzes (only a very small amount of) fat.

**Small intestine**
Cholecystokinin (CCK) signals the gallbladder to release bile (via the common bile duct):

- Fat → Bile → Emulsified fat

Pancreatic lipase flows in from the pancreas (via the pancreatic duct):

- Emulsified fat (triglycerides) → Lipase → Monoglycerides, glycerol, fatty acids (absorbed)

**Large intestine**
Some fat and cholesterol, trapped in fiber, exit in feces.
The Emulsification of Fat by Bile

In the stomach, the fat and watery GI juices tend to separate. The enzymes in the GI juices can’t get at the fat.

When fat enters the small intestine, the gallbladder secretes bile. Bile has an affinity for both fat and water, so it can bring the fat into the water.

Bile’s emulsifying action converts large fat globules into small droplets that repel each other.

After emulsification, more fat is exposed to the enzymes, making fat digestion more efficient.

Stepped Art
Fig. 5-14, p. 150
Hydrolysis of a Triglyceride

The triglyceride and two molecules of water are split. The H and OH from water complete the structures of two fatty acids and leave a monoglyceride.

These products may pass into the intestinal cells, but sometimes the monoglyceride is split with another molecule of water to give a third fatty acid and glycerol. Fatty acids, monoglycerides, and glycerol are absorbed into intestinal cells.
Bile’s Routes

Enterohepatic circulation

Reabsorbed and recycled
Absorption of Fat

1. **Glycerol and small lipids** such as short- and medium-chain fatty acids can move directly into the bloodstream.

2. **Large lipids** such as monoglycerides and long-chain fatty acids combine with bile, forming micelles that are sufficiently water soluble to penetrate the watery solution that bathes the absorptive cells. There the lipid contents of the micelles diffuse into the cells.

---

Via blood to liver

Via lymph to blood
Lipid Absorption

- Directly into bloodstream
  - Glycerol and short- & medium-chain fatty acids
- Lymphatic system
  - Micelles diffuse into intestinal cells
  - Reassembly of triglycerides
  - Packed with proteins – chylomicrons
  - Bypass liver at first
Fat Absorption

http://nutrition.jbpub.com/animations/animations.cfm?id=11&debug=0
A typical lipoprotein contains an interior of triglycerides and cholesterol surrounded by phospholipids. The phospholipids’ fatty acid “tails” point towards the interior, where the lipids are. Proteins near the outer ends of the phospholipids cover the structure. This arrangement of hydrophobic molecules on the inside and hydrophilic molecules on the outside allows lipids to travel through the watery fluids of the blood.
Chylomicrons:
- Largest & Least Dense
- Transport diet derived lipid (Trig) from the intestine, through the lymph, to the blood and the rest of the body
- As chylomicrons pass through bloodstream, cells remove lipids from them
- Liver cells remove the remnants from the blood and reassemble them into new triglycerides
Lipid Transport

**Very Low Density Lipoprotein (VLDL)**
- Made in Liver
- Transport lipids from the liver to the rest of the body
  - Mainly triglyceride (50%)
- As VLDL travel throughout the body, cells remove triglyceride
- As they lose triglyceride, the proportion of cholesterol increases and they become a low density lipoprotein (LDL).
Lipid Transport

Low Density Lipoprotein (LDL)

- Composed primarily of **cholesterol**
- Circulate throughout the body and release triglyceride, cholesterol and phospholipid to body cells.
- Body cells collect the lipids and use them to make cell membranes, hormones, or store for later use.
- Liver removes LDL from circulation
- Often termed “**Bad Cholesterol**” because this is the lipoprotein that is linked to heart disease.
Lipid Transport

High Density Lipoprotein (HDL)

- Liver makes HDL to remove cholesterol from the cells and bring it back to the liver for recycling or disposal.
- By decreasing cholesterol in the arteries, HDL lowers heart disease risk; often called the “Good Cholesterol”
Size Comparisons of the Lipoproteins

Chylomicrons contain so little protein and so much triglyceride that they are the lowest in density.

Very-low-density lipoproteins (VLDL) are half triglycerides, accounting for their very low density.

Low-density lipoproteins (LDL) are half cholesterol, accounting for their implication in heart disease.

High-density lipoproteins (HDL) are half protein, accounting for their high density.

Notice how large the fat-filled chylomicron is compared with the others and how the others get progressively smaller as their proportion of fat declines and protein increases.
Lipid Transport

Intestinal cells form chylomicrons from dietary lipids.

Chylomicrons deliver dietary lipids to most of the body's cells.

Liver cells receive small lipids directly from the intestine.

As cells remove lipids from the chylomicron, it becomes a smaller chylomicron remnant.

Liver cells remove chylomicron remnants from the blood.

Liver cells synthesize lipids.

Liver cells form VLDL, which deliver lipids to the body's cells.

Liver cells form HDL, which pick up cholesterol from the body's cells.

LDL delivers lipids to body cells or return to the liver.

HDL delivers cholesterol to the liver for excretion.

As cells remove lipids from the VLDL, it forms a smaller LDL.

Fat cell

Muscle

Liver

Key:
- Chylomicron
- LDL
- Chylomicron remnant
- HDL
- VLDL
Health Implications

- High LDL is associated with high risk
- High HDL is associated with low risk

Factors that lower LDL and or Raise HDL
- Weight control
- Mono or polyunsaturated fat instead of saturated
- Soluble fiber
- Physical Activity
- Moderate Alcohol

Essential Fatty Acids

Linoleic acid and Linolenic acid

- Fatty acids that the body cannot make or cannot make in sufficient quantities
- Must be supplied by the diet
- Found in plant and animal sources
- Vegetable Oils, Nuts, Seeds, Fish, Seafood, Meats
- With adequate linoleic acid and linolenic acids, the body can make other members of the lipid family (such as Arachidonic)

The first number indicates the number of carbons and the second, the number of double bonds. Similar reactions occur when the body makes the omega-3 fatty acids EPA and DHA from linolenic acid.
Essential Fatty Acids

Linoleic Acid- Omega 6 fatty acid
- Vegetable oils and meats

Linolenic Acid- Omega-3 fatty acid
- Canola, Soybean, Nuts, Seeds
- Fish Oils-Salmon, Mackerel, Menhaden, Tuna, Sardines, and Lake Trout
- Essential for normal growth and development, especially eyes and brain
- May help with prevention and/or treatment of heart disease, hypertension, arthritis, and cancer
Omega-3 Fatty Acids

- With adequate linolenic acid, the body can make other members of the omega-3 family such as:
  - DHA: docosahexaenoic acid
  - EPA: eicosapentaenoic acid
    - Used to make "eicosanoids" - biologically active compounds
    - Help lower blood pressure
    - Prevent clot formation
    - Protect against irregular heartbeats
    - Reduce inflammation
Essential Fatty Acids

- **Fatty Acid Deficiency**
  - U.S. diets meets essential fatty acid needs
  - Historically, deficiencies developed in children fed fat-free milk or in hospitalized patients fed fat-free formulas
  - Symptoms:
    - Growth retardation
    - Reproductive Failure
    - Skin lesions
    - Kidney Disease
    - Neuro and visual problems
Lipid Metabolism

Storing Fat as Fat:
- Fat is stored as triglyceride in adipose tissue.
- Adipose tissue has an unlimited capacity to store fat.
- Lipoprotein Lipase - An enzyme on the surface of the adipose cell
- Inside the cell the pieces are reassembled into triglyceride for storage or energy use
An Adipose Cell

Newly imported triglycerides first form small droplets at the periphery of the cell, then merge with the large, central globule.

As the central globule enlarges, the fat cell membrane expands to accommodate its swollen contents.

Triglycerides can be made from:
Carbohydrate
Protein, and Fat

Adipose tissue. During times of weight gain, excess fat consumed in the diet is stored in the adipose tissue.
Lipid Metabolism

Using Fat for Energy:
- Fat provides 60% of energy needs during rest
- Glycerol and fatty acids are released directly into the bloodstream for cells to use for energy
- 1 pound of fat = 3500 kcal.
- Only the glycerol portion of triglyceride can be converted to glucose for brain, nerve and RBCs
- the fatty acids cannot be converted to glucose.
Health Effects of Saturated Fats

Heart Disease
- Leading cause of death in adults
- Elevated LDL cholesterol is a major risk factor for heart disease
- Cholesterol based plaque buildup restricts and blood flow and raises blood pressure
- **Saturated fats** raise LDL cholesterol levels much more dramatically than food cholesterol and promote blood clotting
Health Effects of Saturated Fats

- **Sources of Saturated fats:**
  - Whole milk, cream, butter, cheese
  - Fatty cuts of beef and pork
  - Coconut, palm and palm kernel oils-candies, pastry, pies, doughnuts, cookies

- **Desirable blood lipid profile**
  - Total cholesterol < 200 mg/dL
  - LDL cholesterol < 100 mg/dL
  - HDL cholesterol ≥ 60 mg/dL
  - Triglycerides < 150 mg/dL
  - Blood lipid profile
Saturated Fats In the U.S. Diet

Note that fruits, grains, and vegetables are insignificant sources, unless saturated fats are intentionally added to them during preparation.
Health Effects of Saturated Fats

- Risks from Trans Fats
  - Trans-fatty acids in the diet
    - increase LDL cholesterol and decrease HDL cholesterol.
  - Food sources include deep-fried foods using vegetable shortening, cakes, cookies, doughnuts, pastry, crackers, snack chips, margarine
  - Butter versus margarine
    - Soft –liquid or tub
    - Trans fat free
    - Liquid vegetable oil as 1st ingredient
    - <2 grams saturated fat
- Food sources of cholesterol include:
  - egg yolks, milk products, meat, poultry and shellfish.

Health Effects of Saturated Fats

**Cancer**
- Does not seem to initiate cancer but may promote it once it has arisen
- Colon Cancer- associated with animal fat
- Breast Cancer-association is unclear

**Obesity**
- Fat 2 x kcal of Protein or Carbohydrate
- High fat diets may exceed energy needs and lead to weight gain
Recommended Intakes of Saturated Fats

- **Recommended Intakes of Fat**
  - The DRI and the Dietary Guidelines recommend:
    - 20-35% of energy intake from fat
    - Limiting 10% of energy intake from saturated fat
    - As little trans fat as possible
    - Less than 300 mg of cholesterol
Health Effects of Mono and Polyunsaturated Fats

- **Heart Disease**
  - Replacing both saturated and trans fats with monounsaturated and polyunsaturated fats reduces LDL cholesterol and lowers heart disease risk

- **Monounsaturated**
  - Olive oil, canola oil, peanut oil, avocados

- **Polyunsaturated**
  - Safflower, sesame, soy, corn, sunflower oils, nuts
Health Effects of Lipids

Benefits from Omega-3 Fatty Acids

Reduced risk of heart disease

- Helps prevent blood clots, lowers blood pressure
- Improve blood lipids, suppress inflammation

- Sources include canola, soybean, flaxseed oils, walnuts, fatty fish (mackerel, salmon, sardines)

- Supplements not recommended unless advised by physician
  - Can increase bleeding time, interfere with wound healing, impair immune function
## Sources of Omega-3 and Omega-6 Fatty Acids

### Table 5-4 Sources of Omega-3 and Omega-6 Fatty Acids

<table>
<thead>
<tr>
<th>Omega-3</th>
<th>Omega-6</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Linolenic acid</strong></td>
<td>Oils (canola, flaxseed, soybean, walnut, wheat germ, liquid or soft margarine made from canola or soybean oil), Nuts and seeds (flaxseeds, walnuts, soybeans), Vegetables (soybeans)</td>
</tr>
<tr>
<td><strong>EPA and DHA</strong></td>
<td>Human milk, Fish and seafood:</td>
</tr>
<tr>
<td></td>
<td>&gt;500 mg per 3.5 oz serving: European seabass (bronzini), herring (Atlantic and Pacific), mackerel, oyster (Pacific wild), salmon (wild and farmed), sardines, toothfish (includes Chilian seabass), trout (wild and farmed)</td>
</tr>
<tr>
<td></td>
<td>150–500 mg per 3.5 oz serving: black bass, catfish (wild and farmed), clam, cod (Atlantic), crab (Alaskan king), croakers, flounder, haddock, hake, halibut, oyster (eastern and farmed), perch, scallop, shrimp (mixed varieties), sole, swordfish, tilapia (farmed)</td>
</tr>
<tr>
<td></td>
<td>&lt;150 mg per 3.5 oz serving: cod (Pacific), grouper, lobster, mahimahi, monkfish, red snapper, skate, triggerfish, tuna, wahoo</td>
</tr>
<tr>
<td><strong>Linoleic acid</strong></td>
<td>Seeds, nuts, vegetable oils (corn, cottonseed, safflower, sesame, soybean, sunflower), poultry fat</td>
</tr>
</tbody>
</table>

Recommended Intakes of Mono- & Polyunsaturated Fats

- 20 to 35 percent of kcalories from fat
  - Includes essential fatty acids
- DRI
  - Linoleic acid – 5-10% of daily energy
  - Linolenic acid – 0.6-1.2% of daily energy
Replacing Saturated with Unsaturated Fat

**TABLE 5-3 Replacing Saturated Fat with Unsaturated Fat**

Portion sizes have been adjusted so that each of these foods provides approximately 100 kcalories. Notice that for a similar number of kcalories and grams of fat, the second choices offer less saturated fat and more unsaturated fat.

<table>
<thead>

Replacing Saturated with Unsaturated Fat

SATURATED FATS MEAL
- 1 c fresh broccoli topped with 1 tbs butter
- 1 c mixed baby greens salad with 2 strips bacon (crumbled)
- 1 oz blue cheese crumble
- 1 tbs light Italian dressing
- 4 oz grilled steak

Energy = 600 kcal

To lower saturated fat and raise monounsaturated and polyunsaturated fats...

UNSATURATED FATS MEAL
- 1 c fresh broccoli sautéed in 1 tbs olive oil
- 1 c mixed baby greens salad with ½ avocado
- 2 tbs sunflower seeds
- 1 tbs light Italian dressing
- 4 oz grilled salmon

Energy = 600 kcal
From Guidelines to Groceries

- Choose lean cuts of meat
- Have 2 servings of fish per week
- Choose fat-free and low-fat milks and milk products
- Vegetables, fruits, and grains
  - Lowers consumption of various fats in the diet
- Invisible fat
  - Fried and baked goods
- Choose wisely
  - Unprocessed foods
Pork chop with fat (340 kcal, 19 g fat, 7 g saturated fat).

Potato with 1 tbs butter and 1 tbs sour cream (350 kcal, 14 g fat, 10 g saturated fat).

Whole milk, 1 c (150 kcal, 8 g fat, 5 g saturated fat).

Pork chop with fat trimmed off (230 kcal, 9 g fat, 3 g saturated fat).

Plain potato (200 kcal, <1 g fat, 0 g saturated fat).

Fat-free milk, 1 c (90 kcal, <1 g fat, <1 g saturated fat).
Fat in Ground Meats

- **Regular ground beef**: 300 cal/3 oz, 4½ tsp fat
- **Ground chuck**: 230 cal/3 oz, 3 tsp fat
- **Commercial ground turkey (with skin ground in)**: 195 cal/3 oz, 2¼ tsp fat
- **Ground round (trimmed, no fat added)**: 180 cal/3 oz, 1½ tsp fat
### Fast Food: Breakfast/Pizza Choices

#### Breakfast Choices

<table>
<thead>
<tr>
<th>Higher in fat</th>
<th>Lower in fat</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BREAKFAST CHOICES</strong></td>
<td><strong>BREAKFAST CHOICES</strong></td>
</tr>
<tr>
<td>2 bacon, cheese, and egg biscuits, hash browns</td>
<td>2 English muffins, jelly, 1 tsp margarine, orange juice</td>
</tr>
<tr>
<td>Total calories</td>
<td>1,500</td>
</tr>
<tr>
<td>% fat Daily Value</td>
<td>100%</td>
</tr>
<tr>
<td>70 g fat</td>
<td></td>
</tr>
<tr>
<td>To reduce fat, ask for half the normal amount of mozzarella cheese; sprinkle the pizza with a tablespoon of parmesan cheese for flavor.</td>
<td></td>
</tr>
</tbody>
</table>

#### Pizza Choices

<table>
<thead>
<tr>
<th>Higher in fat</th>
<th>Lower in fat</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PIZZA CHOICES</strong></td>
<td><strong>PIZZA CHOICES</strong></td>
</tr>
<tr>
<td>2 slices of pepperoni, sausage, and extra-cheese pizza</td>
<td>2 slices of mushroom, onion, green pepper, and cheese pizza</td>
</tr>
<tr>
<td>Total calories</td>

</tr>
<tr>
<td>36 g fat</td>
<td></td>
</tr>
</tbody>
</table>

Note: Fat Daily Value based on a 2,000-calorie diet.
Fast Food: Taco/Burger Choices

Look for taco places that serve reduced-fat cheeses, fat-free sour cream, and baked taco shells.

Some sandwich shops feature low-fat submarine sandwiches, but to keep fat grams low, ask them to hold the oil and mayonnaise.

- **Taco Choices**
  - Higher in fat: 2 regular beef tacos, cheese nachos
  - Total calories: 1,500
  - % fat Daily Value: 880 (77%)
  - 50 g fat

  - Lower in fat: 2 bean burritos, tomato salsa
  - Total calories: 1,500
  - % fat Daily Value: 880 (38%)
  - 25 g fat

- **Sandwich Choices**
  - Double big bacon cheeseburger on a bun, ice cream shake, fries
  - Total calories: 1,475
  - % fat Daily Value: 103%
  - 67 g fat

  - 12-inch turkey submarine sandwich on whole-wheat roll, fat-free milk, a pickle
  - Total calories: 1,500
  - % fat Daily Value: 680 (13%)
  - 8 g fat
## Counting College Calories

- **Krispy Creme glazed doughnut:** 200 Kcal, 12 g fat
- **Starbucks Grande Frappuccino:** 270 Kcal, 4 g fat
- **McDonald’s Big Mac:** 530 Kcal, 33 g fat
- **Super size fries:** 610 Kcal, 29 g fat
- **Jack in Box taco:** 170 Kcal, 9 g fat
- **Subway steak and cheese:** 412 Kcal, 18 g fat
- **2 large pieces of Dominos pizza pepperoni:** 614 kcal, 24 g fat
# High-Fat Foods and Heart Disease

## TABLE H5-1  Major Sources of Various Fatty Acids

<table>
<thead>
<tr>
<th>Healthy Fatty Acids</th>
<th>Omega-6 Polyunsaturated</th>
<th>Omega-3 Polyunsaturated</th>

**NOTE:** Keep in mind that foods contain a mixture of fatty acids.
The Mediterranean Diet

- Traditionally
  - Low in saturated fat
  - Very low in trans fat
  - Rich in unsaturated fat
  - Rich in complex carbohydrate and fiber
  - Rich in nutrients and phytochemicals
- Benefits for heart disease risk
Mediterranean Diet Plan

Mediterranean Diet Pyramid
A contemporary approach to delicious, healthy eating

- Meats and sweets
  - Less often (no more than a few times a month)
- Poultry, eggs, cheese, and yogurt
  - Moderate portion, daily to weekly
- Fish and seafood
  - Offer at least two fish meals per week
- Fruits, vegetables, grains
  - Mostly whole, olive oil, beans, nuts, legumes, and seeds, herbs, and spices
  - Base every meal on these foods
- Drink water

Be physically active
Enjoy meals with others

Fat Replacers

Olestra:

Artificial fat.
Sucrose molecule with 6-8 fatty acids attached
Digestive enzymes are unable to break bonds.
Passes through undigested.
Looks, feels, tastes like fat
High heat stable-fry, cook, bake
Provides 0 kcal.
Used in snack foods, chips, crackers
  May cause digestive distress: cramps, bloating, gas, diarrhea, fecal urgency, and anal leakage
Binds with fat soluble vitamins (A, D, E, K)
End of Chapter 5
